Workflows manage the stages that your participation must navigate within and through while accessing TMA.

For example, until they are published, your status correction documents will have you following a specific workflow to fill in **YOUR RED LETTERS** and to then save the result for review, then final saving, then recording, downloading and printing your hard copy.

The components to manage workflows is being developed this early summer of 2024 to be enabled by default in all Assembly functional areas.

To see the workflow that we have provided with the sample data, you first need to enable this functionality.

1. Access the administration area
2. From 'Content' > 'Articles' > 'Options' > 'Integration' tab set 'Enable workflow' to 'Yes'
3. Save changes

Now when you access 'Content' again you will see the section 'Workflows'. Now too, as conditional content comes online we will be able to tailor the direction taken from various input.

When you edit an article you will also see the new transitions for articles related to workflows.
